GLOBAL RISK & COMPLIANCE OUTLOOK REPORT

2026

A market-facing perspective on regulatory change, risk exposure, and institutional readiness

February 15, 2026

EXECUTIVE SUMMARY

The global banking sector enters 2026 amid sustained regulatory pressure, uneven economic recovery, and accelerating digital transformation. Financial institutions are managing a widening risk surface shaped by macroeconomic uncertainty, geopolitical fragmentation, evolving financial crime patterns, and increased reliance on complex technology ecosystems.

For Caldrin Capital Group, the risk and compliance agenda in 2026 extends beyond regulatory adherence. Institutions are now expected to demonstrate resilience, transparency, and adaptability in how risk is identified, measured, and managed across jurisdictions. Regulators, investors, and customers alike are placing greater emphasis on governance quality, operational discipline, and the institution's ability to respond to change without disruption.

This report presents a market-facing view of the global risk and compliance landscape. It outlines key regulatory developments, identifies the most material risk trends impacting banks, examines regional exposure patterns, and highlights priority compliance focus areas. It concludes with implications for financial institutions and a forward-looking outlook for the year ahead.

GLOBAL REGULATORY LANDSCAPE

In 2026, regulatory frameworks continue to expand in scope and complexity, reflecting lessons learned from recent market disruptions, technology failures, and financial misconduct cases. Supervisory authorities are increasingly outcome-focused, assessing not only whether controls exist, but whether they function effectively under stress.

Across major markets, regulators are reinforcing expectations in several areas. Capital and liquidity adequacy remain foundational, with heightened scrutiny on stress testing assumptions and scenario modeling. Operational resilience has become a core supervisory priority, encompassing business continuity, technology resilience, and third-party risk management. Data privacy and cybersecurity regulations continue to tighten as institutions manage larger volumes of sensitive customer and transaction data.

IMPLICATIONS FOR FINANCIAL INSTITUTIONS

The evolving risk and compliance environment places sustained pressure on financial institutions to modernize their operating models. Fragmented systems, manual controls, and siloed data limit visibility and slow response times, particularly across complex organizational structures.
